3

characteristics, compactness, easy controllability, low power consumption, high force output and deflections/amount of motion, natural stiffness, sensing and actuation functions, relatively low raw materials cost, and relatively inexpensive manufacturing cost, making them desirable for haptic feed- 5 back and sensing devices.

These and other advantages of the present invention will become apparent to those skilled in the art upon a reading of the following specification of the invention and a study of the several figures of the drawing.

## BRIEF DESCRIPTION OF THE DRAWINGS

- FIG. 1 is a block diagram illustrating a haptic feedback system suitable for use with the present invention;
- FIG. 2a is a side elevational view of an electroactive polymer element in a bending motion;
- FIG. 2b is a top plan view of an electroactive polymer element in a bending motion;
- FIG. 2c is a side elevational view of an electroactive polymer sandwich structure providing linear and bending motion;
- FIG. 2d is a perspective view of an electroactive polymer element in a cylindrical configuration to provide motion in 25 multiple degrees of freedom;
- FIG. 2e is a perspective view of an electroactive polymer structure that provides an area expansion of the element;
- FIG. 2f is a perspective view of an electroactive polymer structure in a cylindrical structure that provides axial motion 30 laterally by an electroactive polymer actuator against a of the element;
- FIG. 3 is a perspective view of an example mouse interface device suitable for use with EAP actuators of the present invention;
- FIG. 3a is a side elevational view of a mouse embodiment 35 in which a button is moved in its degree of freedom by an electroactive polymer actuator;
- FIG. 3b is a top plan view of a mouse embodiment in which a button is moved laterally by an electroactive poly-
- FIG. 3c is a top plan view of a mouse embodiment in which a button includes an array of multiple electroactive polymer actuators;
- FIG. 4a is a schematic view of an embodiment in which an inertial mass is moved linearly by an electroactive 45 polymer actuator to provide inertial sensations;
- FIG. 4b is a schematic view of an embodiment in which an inertial mass is moved rotationally by an electroactive polymer actuator to provide inertial sensations;
- FIG. 4c is a view of an embodiment in which multiple inertial masses are moved by an electroactive polymer
- FIG. 5a is a side view of a mouse embodiment in which a entire cover portion of the mouse is moved by an electroactive polymer actuator to provide tactile sensations;
- FIG. 5b is a top plan view of a mouse embodiment in which side portions of the mouse are moved by an electroactive polymer actuator to provide tactile sensations;
- FIG. 5c is a top plan view of a mouse embodiment in  $_{60}$ which top portions of the mouse are moved by an electroactive polymer actuator to provide tactile sensations;
- FIG. 5d is a side view of a mouse embodiment in which a rear top portion of the mouse is moved by an electroactive polymer actuator to provide tactile sensations;
- FIG. 6 is a top view of an embodiment in which a sphere is braked by an electroactive polymer actuator;

- FIG. 7a is a side view of a wheel embodiment in which a rotatable wheel includes an inertial mass that is rotationally moved by an electroactive polymer actuator;
- FIGS. 7b and 7c illustrate a wheel embodiment including a number of electroactive polymer actuators which expand
- FIG. 7d is a perspective view of a wheel embodiment in which a rotatable wheel is braked by an electroactive polymer actuator;
- FIG. 7e is a side elevational view of a wheel embodiment in which the entire rotatable wheel is moved laterally and vertically by electroactive polymer actuators;
- FIG. 8a is a perspective view of a trackpoint controller in which an electroactive polymer actuator provides haptic feedback in its degrees of freedom;
- FIGS. 8b and 8c is perspective and side sectional views of a trackpoint controller in which an electroactive polymer actuator provides haptic feedback by linearly moving a poker against the user;
- FIG. 8d is a perspective view of a trackpoint controller in which electroactive polymer actuators provide haptic feedback in linear degrees of freedom;
- FIG. 9a is a perspective view of a vertical pin moved linearly by an electroactive polymer actuator against a user's
  - FIGS. 9b and 9c are perspective views of arrays of the vertical pins of FIG. 9a;
- FIGS. 9d and 9e are side views of a vertical pin moved user's finger;
- FIG. 10 is a side elevational view of a device in which an electroactive polymer actuator provides braking forces on a medical tool;
- FIG. 11 is a side elevational view of a device in which an electroactive polymer actuator provides forces to a trigger on an interface device;
- FIG. 12a is a front view of a knob in which an electroactive polymer actuator provides direct rotary forces in the rotary degree of freedom of the knob;
  - FIG. 12b is a perspective view of a knob in which an electroactive polymer actuator provides braking forces in the rotary degree of freedom of the knob;
- FIG. 13 is a side view of a rotating disc in which an electroactive polymer actuator provides braking forces in the rotary degree of freedom of the disc;
- FIG. **14***a* is a side elevational view of a stylus in which an electroactive polymer actuator provides linear forces to the tip of the stylus;
- FIG. 14b is a side elevational view of a stylus in which an electroactive polymer actuator provides linear forces to the front end of the stylus;
- FIG. 14c is a side elevational view of a stylus in which an electroactive polymer actuator provides forces to a button on the stylus;
- FIGS. 14d and 14e are side elevational and perspective views of a stylus in which electroactive polymer actuators provide outward forces from the stylus body;
- FIG. 15a is a front view of a steering wheel in which an electroactive polymer actuator provides inertial forces;
- FIG. 15b is a side view of a joystick handle in which an electroactive polymer actuator provides inertial forces;
- FIGS. 15c and 15d are perspective and side elevational views of a joystick handle in which electroactive polymer actuators provide braking forces in the degrees of freedom of the joystick handle;
